

RepMint

A personal trainer, living in your camera.

Real-time rep counting, spoken coaching, AI plans —
nothing but a phone.

AI MVP CHALLENGE · TEAM REPMINT

PROBLEM

Training alone is guesswork.

€50–80

per personal-training session — out of reach for most students and young professionals

4 in 5

gym-goers train with no feedback at all: no rep quality, no form check, no plan logic

0

fitness apps that can actually SEE you — they log what you type, not what you do

A person is performing a squat in a dark, empty gym. The gym is filled with various exercise machines and weights, but they are mostly in shadow. A single bright light source from above illuminates the person and the floor around them, creating a strong contrast with the surrounding darkness. The person is in the middle of a squat, with their back to the camera.

Nobody is watching.

And form is the first thing that breaks.

Need · Approach · Benefits · Competition

Need

Affordable, real-time form guidance for people who train without a coach — feedback in the set, not after it.

Approach

33-point pose AI runs on-device in the browser. Honest rep counting, spoken cues, AI plans, and social accountability — no hardware, no install.

Benefits

A coach that sees, speaks, plans, and remembers — for the price of a coffee, not a PT. Video never leaves the phone.

Competition

Freeletics & Fitbod plan but can't see you. Tempo/Tonal mirrors see you for €2,000+ of hardware. PTs see you but don't scale. We're the only camera-native software coach.

Three people, one missing coach.

Mateo, 26 — the optimizer

Trains in fixed 45–75 min windows between classes. Abandons anything with more than two decisions.

Est. duration on everything, a sanctioned 20-min short version, week-over-week data.

Priya, 22 — the home beginner

Dorm room, no equipment, would never build a workout from a blank screen. Afraid of doing it wrong.

Ready-made room workouts, plain-language cues, on-device camera privacy, 'you did it right' feedback.

Lukas, 29 — the streak-keeper

Ex-athlete, checks his streak every morning. Busy weeks kill momentum and the habit with it.

A legit 15-min minimum session, one calendar for everything, weekly competitions with friends.

Idea to deployed product in three weeks.

Week 1 — See

Camera engine: 33-landmark pose tracking in the browser, honest rep counting, per-rep quality scoring, 115-exercise registry with per-movement form checks.

Week 2 — Think

Full platform: AI weekly plans + one-off day workouts, coach chat with long-term memory, history, insights, workout builder — Supabase backend with RLS on every table.

Week 3 — Feel

Realtime voice coaching, community (friends, shared workouts, weekly competitions), design system, hardening pass — deployed on Vercel.

Shipped: 45+ production deployments · 13 database migrations · 115 exercises with custom AI-illustrated muscle maps
· live at repmint.vercel.app

One coach. Five superpowers.

It sees

On-device pose AI at 30fps. Only full range-of-motion reps count — half-reps don't fool it. Depth, tempo, time-under-tension, velocity-loss fatigue.

It speaks

A natural realtime voice in your ear during the set: one cue at a time, human trainer energy, ~300ms latency. Silent when it should be.

It thinks

AI weekly plans around your real life, one-off day workouts on demand, and a chat coach grounded in your actual training data.

It connects

Friends, shared workouts, and week-long competitions on reps, sets, sessions, or minutes — accountability built in.

It protects

Video never leaves the device. Pose runs in the browser; only your numbers sync. Privacy is architecture, not a policy page.

Enough slides.

Live demo · repmint.vercel.app

LIVE DEMO

Watch it count. Hear it coach.

- 1 Prop the phone, raise a hand — 3·2·1, the set starts hands-free
- 2 Squats live on stage: honest reps, depth %, one spoken cue at a time
- 3 Ask the AI for a workout: "chest and triceps, 30 minutes" — saved in seconds
- 4 Coach chat: "did the pause trick work?" — answers from real session data
- 5 Community: live leaderboard in this week's competition

Deployed & open —
try it during Q&A

repmint.vercel.app

The coach that scales like software.

Freemium, camera-first

Free

Camera coach, rep counting, starter workouts — the hook that shows the magic in 30 seconds.

Premium · €9.99/mo

AI plans & day workouts, realtime voice, insights & load trends, competitions.

Later · B2B

White-label for gym chains and university sports programs — every member gets a coach.

\$6.8B

fitness app market, growing double-digit annually

~€0.05

our AI cost per active training day — 99% gross margin on €9.99

K-factor

competitions require friends — the product invites for us

Heavy where it matters, light everywhere else.

Phone / browser

Next.js 15 static app (Vercel CDN)

MediaPipe pose — 33 landmarks, 30fps, fully on-device

Rep engine + form scoring (deterministic logic)

WebRTC audio ← realtime voice

Video NEVER uploaded

Supabase

Postgres + row-level security on every table

Auth (email + magic link)

Edge functions: ai-coach, generate-plan, tts, realtime-token...

Only numbers & text stored — never media

AI providers

OpenRouter → any LLM (user-selectable model)

Gemini fallback chain

OpenAI Realtime — voice over WebRTC

Keys live server-side only

Built to be trusted, not just demoed.

Hallucinated exercises

Plans validate against a 115-slug allowlist — the model cannot invent a movement; outputs are clamped and re-asked once on invalid JSON.

Provider outages

Every AI call has a fallback chain: OpenRouter → Gemini; realtime voice → TTS → on-device speech. The workout never goes silent.

Data leakage

Row-level security on every table; the leaderboard is a guarded aggregate function — raw sessions stay private even from friends.

Overreach

Coach declines off-topic and medical questions; 'coaching guidance, not medical advice' on every chat; claim-safe copy throughout.

Runaway voice

The realtime agent physically cannot self-trigger: no microphone attached, turn-detection off, speaks only queued cues, session closes after the final line.

What's next — and what we proved.

Next

- Wearables: Strava sync + heart-rate for effort-aware coaching
- Exercise form video library + camera-position guides
- Workout marketplace: creators publish, athletes follow
- B2B pilots: gym chains & university sport programs
- Native companion for Apple Watch

What we proved

- AI is necessary here, not decorative — no camera, no product
- The full loop works today: see → coach → plan → remember → compete
- Deployed, secured, and demo-able by anyone in this room right now

*A smaller working MVP with evidence
beats an ambitious fake demo.*

Stop guessing. Start counting.
